Early Neuroscience Research at the Medical Faculty of Tartu University in Estonia

Bengt Ljunggren,* Ilo Käbin,† George Bruyn,‡ and Michael Buchfelder§

*Division of Neurosurgery, Faculty of Medicine and Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates; †Lund University, Lund, Sweden; ‡Department of Neurology, Leiden University, Leiden, The Netherlands; §Department of Neurosurgery, Erlangen-Nürnberg University, Erlangen, Germany

Summary: In 1632, King Gustav Adolf II of Sweden founded a university, the Academia Gustaviana, in Tartu in Estonia, which at that time was part of Sweden. After the Swedish defeat in the Great Nordic War in 1710, Estonia became part of Russia. The University of Tartu was then closed until 1802, when Czar Alexander I ordered its reopening with the intention of attracting Western culture and science to Russia. The medical faculty of Tartu University drew distinguished neuroscientists from around the world, among them Kupffer, Rauber, Schmidt, Buchheim, Schmiedeberg, von Bergmann, Kernig, and Puusepp, and became a flourishing academic eastern outpost in medicine. After suffering severe setbacks and destruction in the 20th century, Tartu University has once again begun to flourish after the liberation of Estonia in 1991. **Key Words:** Estonia—Tartu University—History of neurosciences.

Estonians are among the oldest nationalities in Europe and have lived for thousands of years on an area of about 45,000 square kilometers bordering the Baltic Sea and the Gulf of Finland (Fig. 1). Until the beginning of the second millennium, Estonians lived much like their Scandinavian neighbors, the Vikings. The present capital of Estonia, Tallinn, was known to the Arabic geographer Abu Abdallah Mohammad al-Idrisi, who depicted the town on his map of the world as *Qualawen* in 1154. In the 13th century, Danish and German crusaders conquered Estonia, and in the next century the Estonians made a desperate attempt to liberate their country. In the 15th century—the age of the Hanseatic League—ravaging expeditions were undertaken in the Baltic Sea by the Crusaders, pirates from neighboring countries. These ravages ceased in the 16th century after long wars among the Russians, Poles, and Swedes. In 1558, Czar Ivan the Terrible conquered Estonia, leading to a massacre of Estonians, especially the male population. In the

next century, however, Estonia fell entirely under Swedish dominion—known as “the good old Swedish time.”

Founding of Tartu University

The first university in Sweden was founded on the Swedish mainland in Uppsala in 1477. In 1632, King Gustav Adolf II founded a second Swedish university, the Academia Gustaviana, in Tartu in eastern Estonia. The universities in Åbo (today Finland) and Lund were founded in 1640 and 1668; the first Russian university, in Moscow, opened in 1755. In 1656, Tartu was again conquered by the Russians, and academic activities were halted until 1690, when the university was reopened, now under the name of Academia Gustavo Carolina.

The Nordic War

In November 1700, the devastating Nordic War broke out, with young King Charles XII of Sweden winning the first battle against his Russian antagonist, Czar Peter the

Ludvig Puusepp—Founder of Estonian Neurosurgery and Harvey Cushing's Eastern Hemisphere Counterpart

Bengt Ljunggren,* George Bruyn,† Ilo Käbin,‡ and Michael Buchfelder§

*Division of Neurosurgery, Faculty of Medicine and Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates; †Department of Neurology, Leiden University, Leiden, The Netherlands; ‡Lund University, Stockholm, Sweden; §Department of Neurosurgery, Erlangen-Nürnberg University, Erlangen, Germany

Summary: Ludvig Puusepp (1875–1942) became the world's first professor in neurosurgery in 1910 in St. Petersburg, and was then active from 1920 until his death in 1942 at the University of Tartu in Estonia. He involved himself in all types of neurosurgical procedures, suggested many innovative surgical improvements, and created an exemplary neurosurgical clinic in Estonia. He also published papers on every conceivable subject of conventional neurosurgery, and books on the surgery of brain tumors and the nervous system. Puusepp was an excellent and dynamic neurosurgeon whose active period—1899 to 1939—exactly coincided with that of Harvey Cushing. It may be concluded that Puusepp was Cushing's counterpart in the Eastern hemisphere. **Key Words:** Ludvig Puusepp—Vladimir Bekhterev—Tartu University—Harvey Cushing—Neurosurgical history.

The Estonian counterpart to Harvey Cushing (1869–1939) was Ludvig Puusepp (1875–1942), a pupil of the founder of Russian neurology, Vladimir Bekhterev. Puusepp introduced and perfected surgery of the nervous system as a specialty in St. Petersburg, Russia, where he was appointed professor of surgical neuropathology in April 1910. Soon after the Bolsheviks seized power, Puusepp left St. Petersburg and moved to the University of Tartu in his father's native country, Estonia. As Earl Walker¹ noted,

“With the outbreak of the Russian Revolution Puusepp's life was endangered. It is said that when Red soldiers threatened him, hospital attendants swore he was a manual laborer. Then, when the rioters had left, Puusepp asked what his assistants had done to get him his freedom. ‘Is not a surgeon a manual laborer?’ was the laconic reply.”²

His departure from Petrograd left a decade-long vacuum in Soviet neurosurgery.

The University of Tartu almost immediately (December 1920) appointed him professor of neurology and director of neuropathology at the Hospital for Nervous Diseases. Apart from his appointment as professor, Puusepp was also made medical officer with the rank of general in the Estonian Army, which fought Estonia's war of liberation against its giant Eastern neighbor with much success after the end of World War I.

Puusepp's arrival in Estonia ushered in a new era in clinical neurology^{3–21} and surgical neurology specifically. Puusepp was a dynamic man with broad interests, ranging from improving neurodiagnostic and neurosurgical procedures^{22,23} to purely scientific research²⁴ and pioneering experimental central nervous system transplantation surgery.^{25–27} He started out by separating the teaching of neurology and surgical neurology from teaching in psychiatry. He soon created a strong neurologic and neurosurgical unit, which included an operating room, a specially equipped neuroradiologic suite, a laboratory for histopathologic examinations, and a unit for physical therapy. The clinic in Tartu attracted a series
